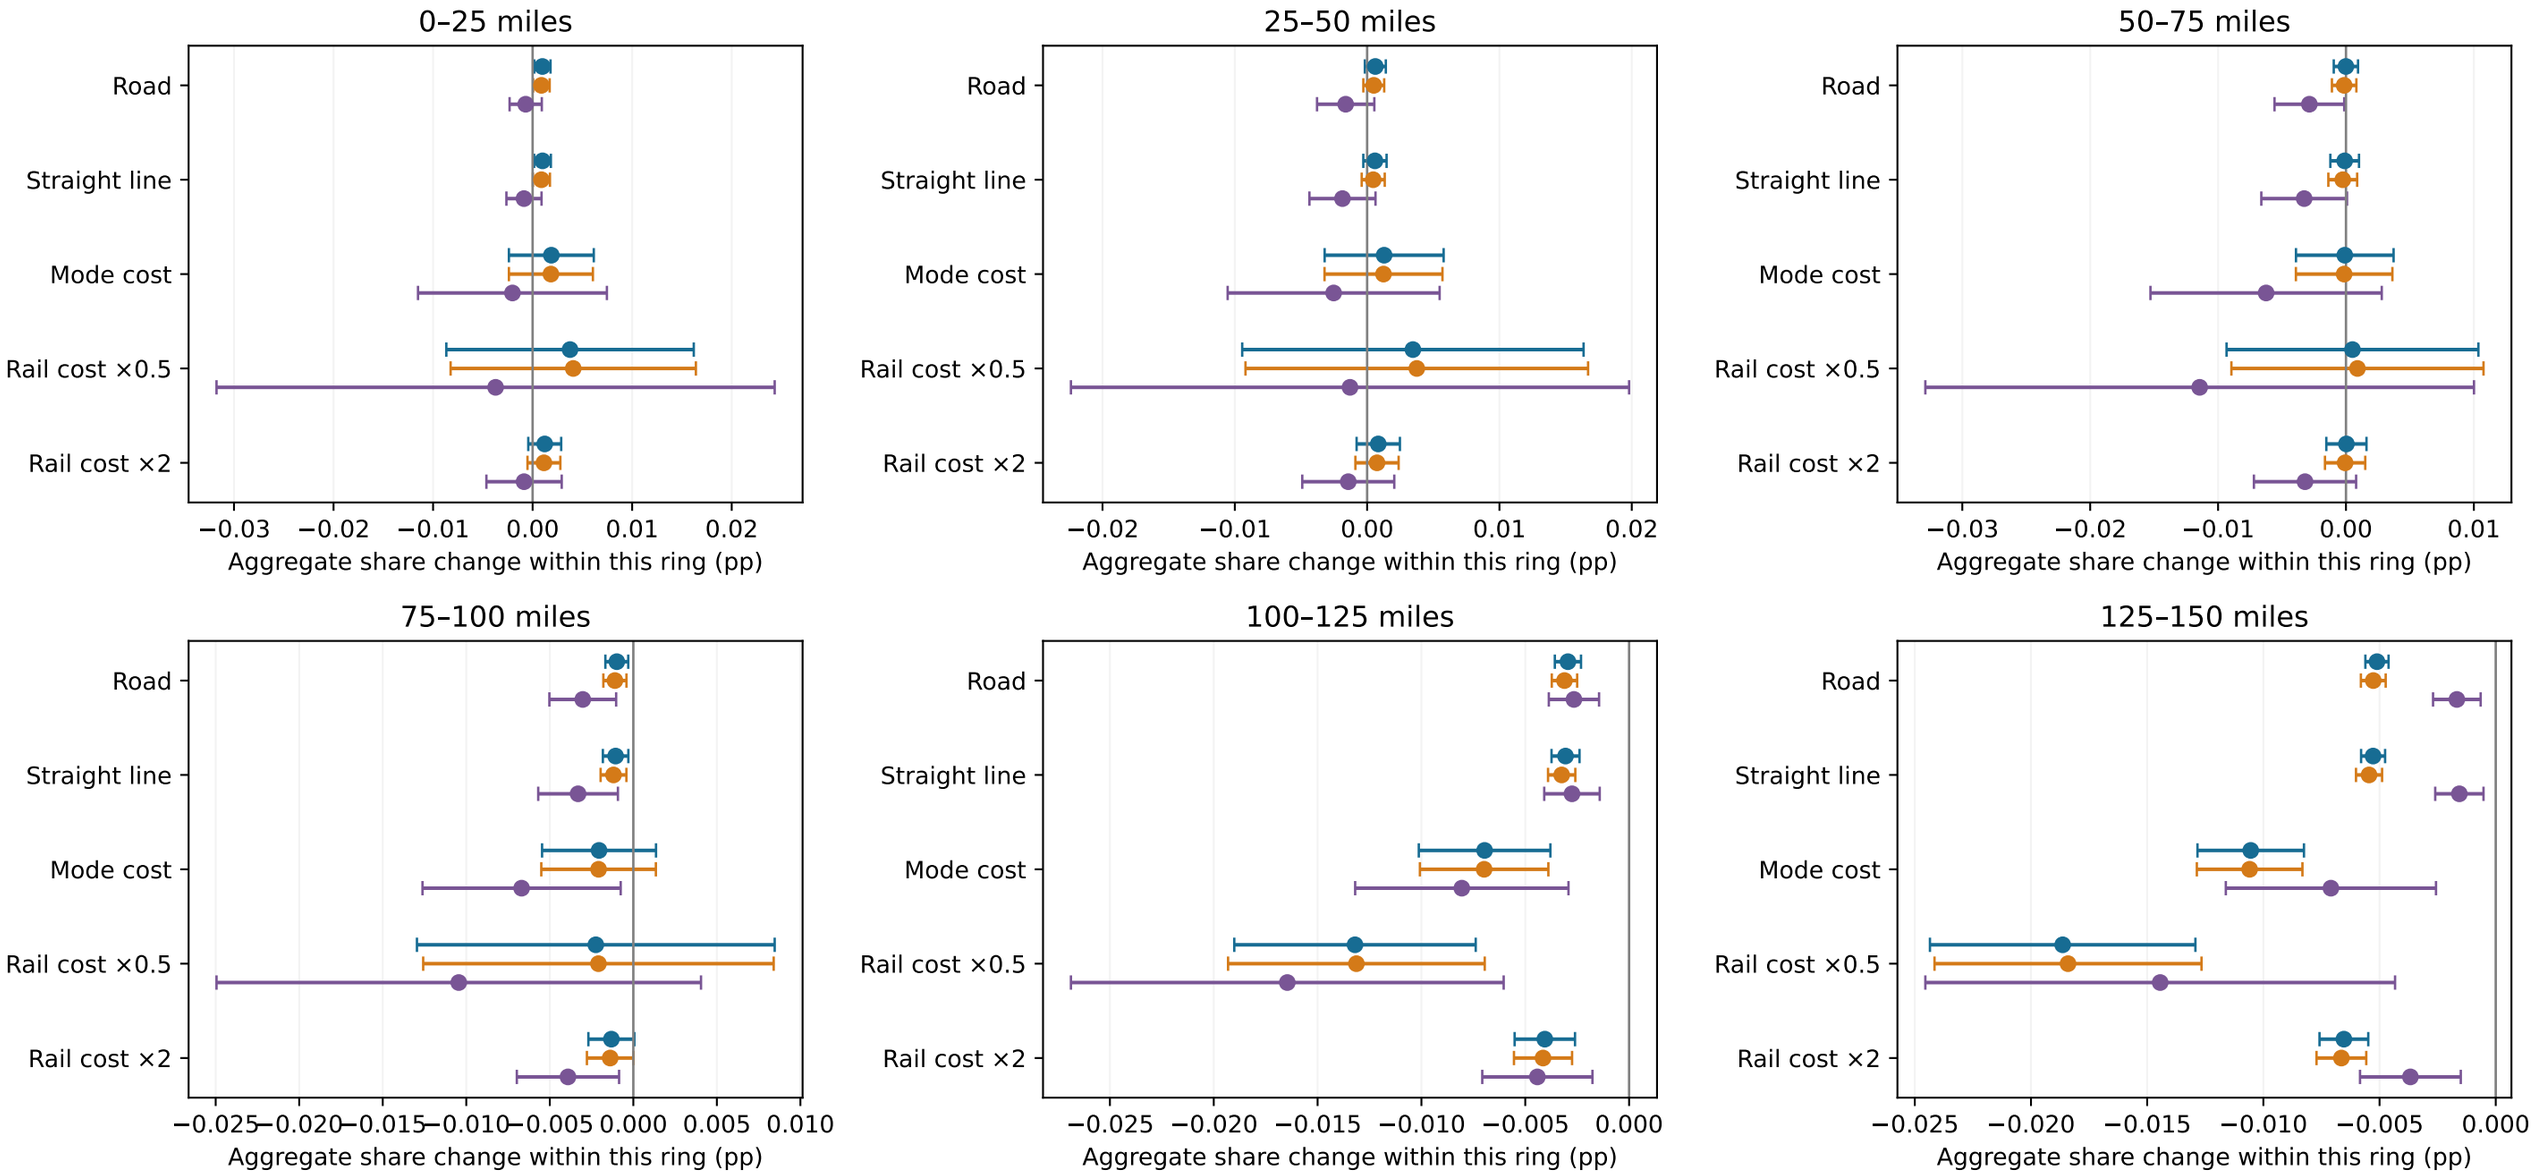
A 100-million-gallon refinery approval: predicted share response by ring

Stock: lag one · Stock: current + lag one · Annual change: lag one



Average over 16 refinery locations; area-weighted across crushers within each individual ring, not combined across rings.
Normalized inverse-square weights; matched 2016–2025 sample; 95% crusher-clustered intervals; nominal inference. Annual-change model predicts a one-time increment response.
