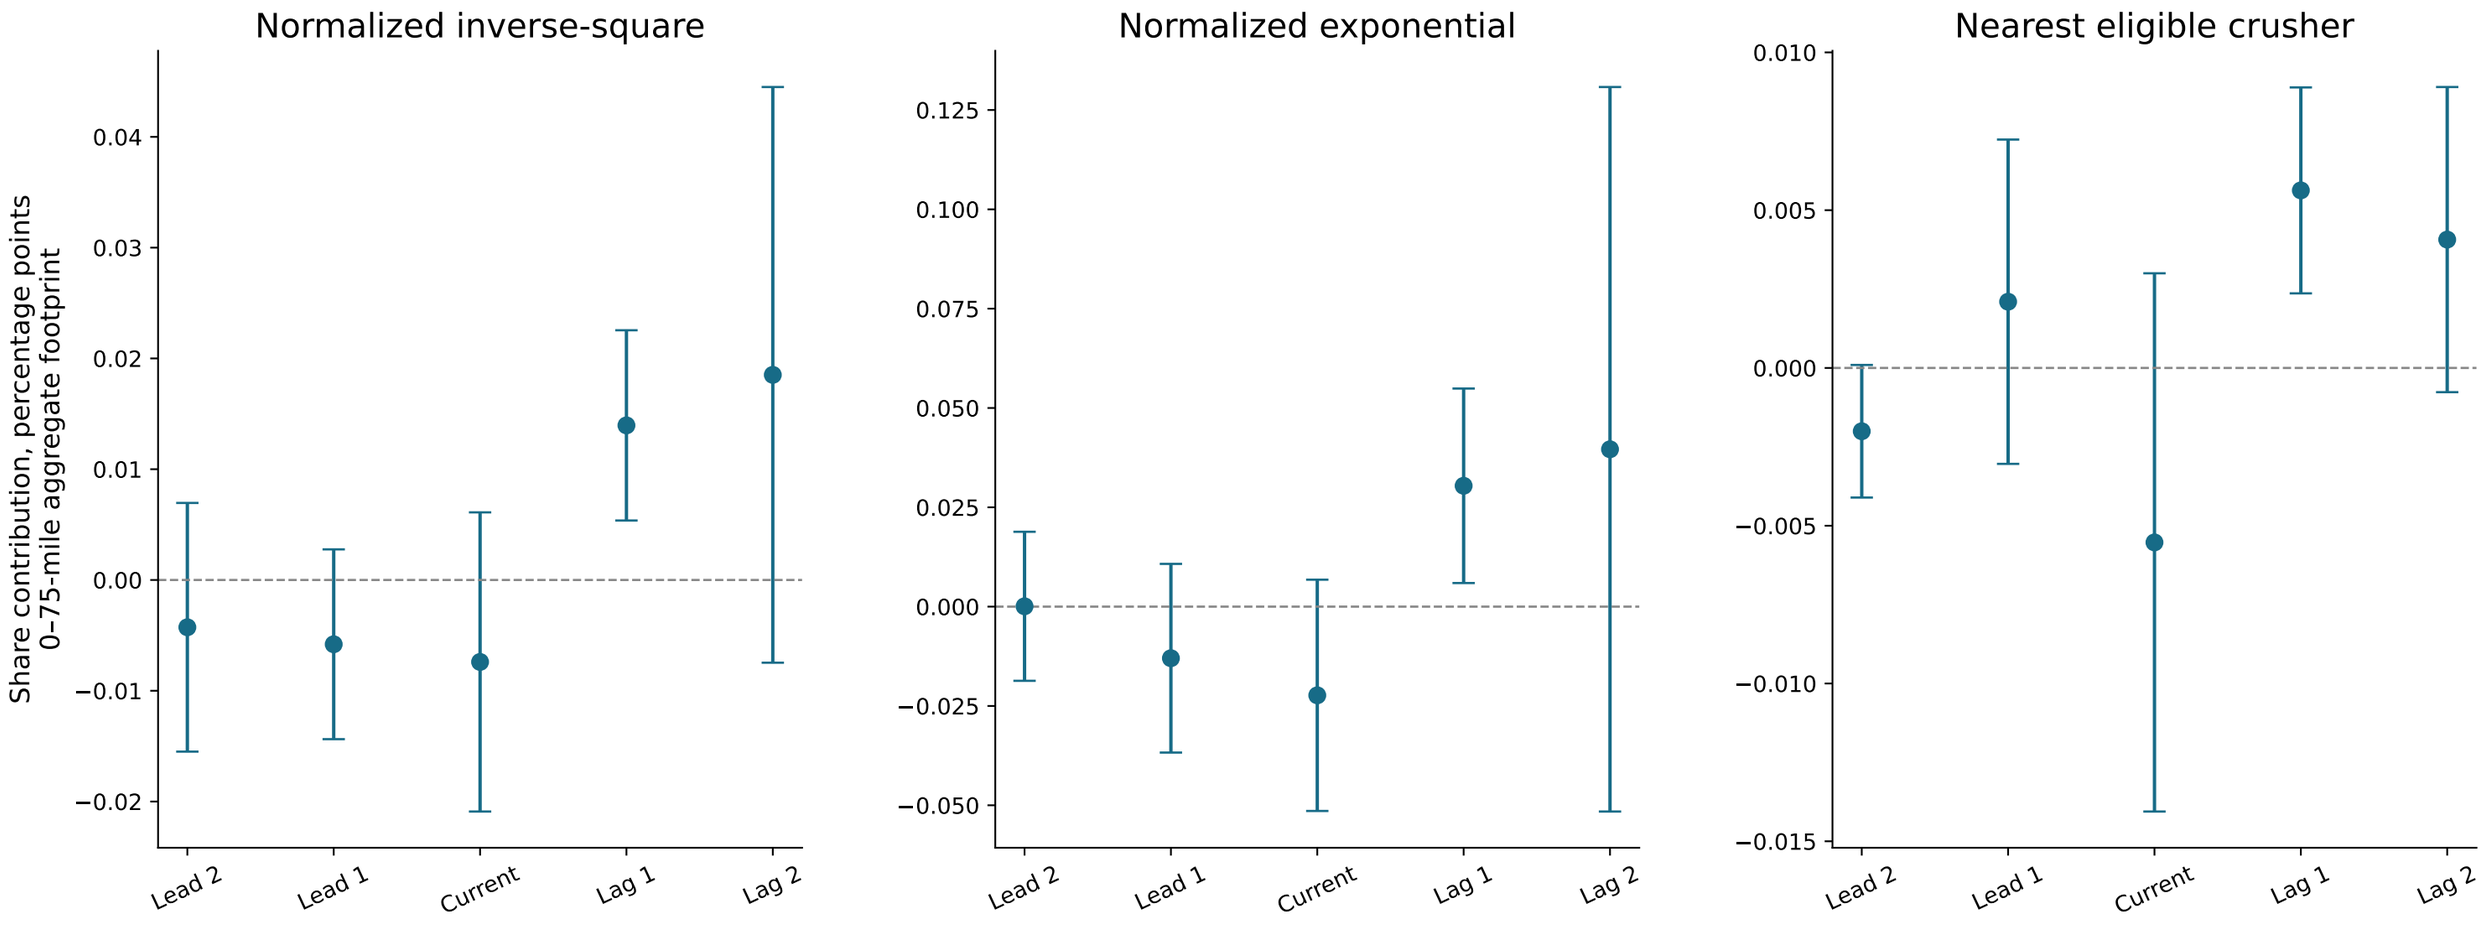
Conditional timing contributions: average +100 million gal/year addition



Equal-location mean across 16 refinery sites; non-water share converted using 2024 polygon areas.
All leads and lags included jointly; crusher-clustered 95% intervals. Separate vertical scales.

2016–2023 common sample. Individual contributions must be combined to obtain a net response to a capacity path.
Future-exposure terms are diagnostics, not proof of anticipation. Multiple testing; observational estimates.
